

ABSTRACT

A picture holder includes a supporting device having two downwardly and outwardly extended flaps, and an upper panel coupled between upper portions of the flaps, to form an inverted U-shaped and stable supporting structure. A loose-leaf binder device is engaged onto and secured to the upper panel of the supporting device, and includes two or more binder rings for detachably attaching photos, and for allowing the pictures or the posts or the photos to be easily changed with each other. The pictures or the posts or the photos may be displayed and seen from both sides of the picture holder.
